The whole space between the two pilasters plain must
is to be filled with panel, like the door,
and be in the same plane (flush) with
the glazed part
the opening part, without sill or lintel,
Thet than those panels above and below,
which come against the beams; and the
whole is to look like the door. Those panels
that are glazed, above, for light in Odeon and
Library, may open or not, perhaps they had
better be secured against the weather, and the
features, not to open, since the side windows
will air and ventilate the rooms sufficiently.
The pilasters may be linked together behind the panel
work by brick, so as to fix the parts, if the builder
thinks best, but no part of the surface, from
top to bottom, is to project over, but be in one
uniform plane, in front, surrounded by a bold
architrave, as per plan, rising to the top of the pilasters.

(Gov. Sarvis.)

Respectfully, Yours A. J. Davis.
