place we cannot refrain from using every means in our power to show to the printed horoscoply they have been received in the character of the man to whom the professorship of mathematics has been assigned. To point to a single instance of his gross neglect of duty, we will state that through the following paragraph was inserted in the last catalogue: 1847;

"The lectures of the Professor of Mathematics and Natural Philosophy are illustrated by experimental lectures with an apparatus selected by the late Dr. Caldwell during a visit made by him to Europe some years since. For that purpose, he has never in a single instance complied with it during the present collegiate year. The Junior classes in a few days will have finished Philosophy, in which they have been engaged eight months, and during this time he has not given them a single experiment, though frequent requests have been made by members of the classes to him. It is of course unnecessary to consume any time in enquiring on the importance of experiments in the study of Philosophy, as every one knows that it is almost impossible to acquire any knowledge of this science without such illustrations; and the high price at which the instruments were purchased conclusively shows the estimation in which this aid to instruction was held by Dr. Caldwell. We have now stated some of the grievances under which we labour. Will a deaf ear be turned to our complaints, and are we to expect no redress for these evils we must not. We have a different idea of those to whom we can the University of our state is entitled."

Respectfully,

A number of students.
